

The Dairy PEF project

2 November 2017, Ittigen, CH (via Skype)

Hélène Simonin

connect to the world of dairy

European Dairy Association

= 22 national dairy industry associations of EU Member States

More than **12,000** production sites across Europe

More than **300,000** direct jobs on milk processing sites

World dairy leaders
5 of the top 10 global dairy companies are European

Balanced & Successful
coexistence of cooperative model and private ownership

Around **50%** of milk collected in Europe by coops

The economic power of European dairy at a glance

Partnering
around 750,000 dairy farms across Europe

Positive EU trade balance
The European milk processing industry brings more than **9.3 billion €** to the overall EU trade balance

A rich and tasty cultural heritage
of more than 300 registered cheeses and dairy products

300

Average daily consumption of dairy per EU citizen

180 ml of milk
23 grams of butter
51 grams of fermented milk
49 grams of cheese

President: Michel Nalet, FR, Lactalis

connect to the world of dairy

Decreased
GHGE by
24% since
1990

20% water
saved in the
dairy chain
since 2005

connect to the world of dairy

Sustainable food: 2020 Vision

There's a broad awareness that as a society we are exceeding the natural limits of our planet. We will need two planets by 2030 to meet overall consumption demands if we carry on as we are.

The core of our vision on sustainability is that Alpro can be part of the solution. Plant-based foods are resource efficient compared to animal-based foods such as dairy products. In other words, they use less planet! We firmly believe that the biggest opportunity for change lies when more consumers consume our products. Together we are taking the necessary steps for our food system.

Plant-based uses less planet!

As shown in a recent Life Cycle Analysis (LCA) report!, eliminating animals from the food production process has a significant impact: it's a choice that results in major savings in CO₂, land and water use. That's demonstrating that changing the way the world eats for the better is feasible.

'Green claims'...

Cow milk production process		Soy drink production process		Almond drink production process	
Cow milk production process		Alpro Soy drink production process		Alpro Almond drink production process	
Land usage: 2.12 (m ²)		Land usage: 0.65 (m ²)		Land usage: 1.16 (m ²)	
Water usage: 1006 (Liter)		Water usage: 365 (Liter)		Water usage: 916 (Liter)	
CO ₂ -eq: 1.30 (Kg)		CO ₂ -eq: 0.25 (Kg)		CO ₂ -eq: 0.38 (Kg)	
		Alpro Soy burger production process			
Beef burger production process		Alpro Soy burger production process			
Land usage: 51 (m ²)		Land usage: 1.1 (m ²)			
Water usage: 15.500 (Liter)		Water usage: 775 (Liter)			
CO ₂ -eq: 16.0 (Kg)		CO ₂ -eq: 1.5 (Kg)			

Comment: While soy drinks contain the high-quality soy protein enriched with calcium, which makes them an equivalent to milk, such protein is not part of nut drinks.

Resource Efficiency Roadmap

2020

April 09th 2013, the European Commission published:

Communication: Single Market for Green Products

Product Environmental Footprint (PEF) Guide

Organisation Environmental Footprint (OEF) Guide

Recommendation

Pilot testing phase: 3 years

Objective

Higher uptake of green products and of greener practices

The Dairy PEF

to the world of dairy

3 industry associations

6 dairy processors

1 retailer

1 LCA consultant

4 public and research bodies

3 packaging associations

- ➔ Cooperative effort of stakeholders of the whole chain
- ➔ Build up methodology from within the sector
- ➔ Realise a simple and workable tool for all actors involved, and all external interested
- ➔ European, and global dimension
- ➔ Build on sector's many years experience of environmental improvement - bring forward whole sector

Steps of the PEF project

1. Definition of the **category**
2. Definition of **representative product***
3. PEF **screening** : identification of most relevant life cycle stages & processes
4. **Draft** of category rules
5. **Supporting studies**: identification of the **most relevant impacts**
6. Determination of **benchmarks**
7. **Communication** phase – studies testing communication vehicles
8. Final changes in category rules – based on conclusions of studies

2014

2015

2016

2017

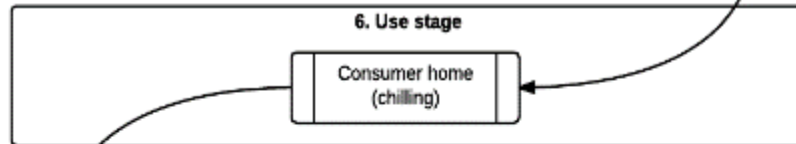

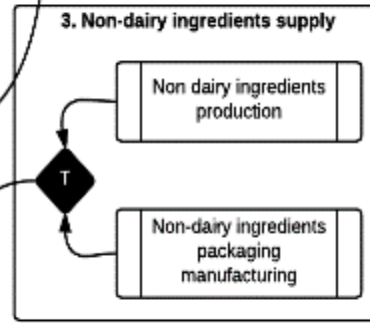

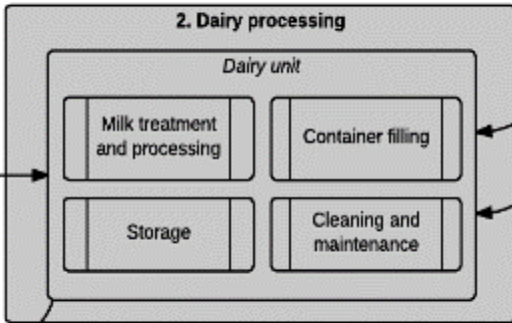

connect to the world of dairy

* May or may not be a real product that one can buy on the EU market. Especially when the market is made up of different technologies, the “representative product” is a virtual (non-existing) product with the average EU sales-weighted characteristics of all technologies around.

Subcategories and supporting studies

Sub-category		Representative product	
Liquid milk		Average of standardised milks with different fat content and thermal treatment	
Dried whey products		Average whey powder, whey protein powder and lactose powder	
Cheeses		Average of unripened, ripened (soft) and ripened (hard) cheese	
Fermented milk products		Average of spoonable yogurts and fermented milk drinks	
Butterfat products		Average butter and and dairy spreads	

Liquid milk	EU-28
Fat content	
Skimmed (<0.3%)	6%
Semi-skimmed (1.5-1.8%)	61%
Whole milk (3.5%)	33%
Thermal treatment	
Pasteurised or filtered	41%
UHT	59%
Packaging	
Multilayer carton 1000 ml	60%
Plastic bottle 1000 ml	35%
Glass bottle 1000 ml	5%
<i>Sensitivity:</i> pouch 1000 ml, plastic (PET) bottle 1000 ml	

-  Identify “hot spots”
-  Compare alternatives
-  Benchmark performance
-  Invest resources intelligently
-  Set goals & measure progress
-  Manage risk
-  Communicate, label & substantiate
-  And more...

...based on
science

- Consumer: differentiate functionally equivalent products to make more « ecological » choices
- Manufacturer: looking for way to reduce the impacts associated with its products, to communicate their environmental merits
- Government: refine environmental legislation, elaborate incentive measures

- Most relevant life cycle stages:
 - Raw milk production
 - Distribution (except for dried whey products, since out of system boundaries)
 - Dairy processing
 - Packaging (for liquid milk and fermented milk products only)
 - Use (for liquid milk only)
- Most relevant processes (per life cycle stage):
 - Raw milk: Feed production and direct emissions at the farm
 - Dairy processing: Electricity, water use and wastewater treatment
 - Packaging: Raw materials manufacturing, especially liquid packaging board (LPB) and plastics
 - Distribution: Chilled transports, chilled storage at retail and transport by the consumer
 - Use: Dishwashing¹
 - End-of-life: not relevant

Photo: HSR

Most relevant impact categories

→ Choice of seven impact categories

+ Biodiversity and deforestation

Impact category	Rationale
Climate change	GHG emissions from cattle (feed production, enteric fermentation and manure) is a recognised environmental issue worldwide. The study showed that this is among the best known and most reliable impact category, for which key elementary flows are commonly measured or documented.
Water resource depletion	Dairy products being at the top of the food pyramid, they play a role in the competition for water, through feed production and drinking needs of cattle. Use of water resources can be influenced by practices at dairy farming.
Freshwater eutrophication	Use of P fertilisers (organic or mineral) for feed production is a well-known environmental issue in the agricultural sector. Eutrophication was also identified as a potential issue in the wastewater treatment of effluents from dairy processing units.
Marine eutrophication	Use of N fertilisers (organic or mineral) for feed production is a well-known environmental issue in the agricultural sector. Proper management of the nitrogen flows, from feed intake to manure is also an important lever for dairy farmers to improve their sustainability record. Highlighted as potentially relevant through normalisation.
Freshwater ecotoxicity	Ecotoxicity is a key issue in working towards sustainable agriculture. Dairy farmers can act upon the use of toxic substances and influence toxic impact of dairy products on natural ecosystems.
Land use	Dairy products being at the top of the food pyramid, they play a role in the competition for arable land, through feed production and grazing areas. Land use and biodiversity can be influenced by practices at dairy farming.
Acidification	Use of N fertilisers (organic or mineral) for feed production is a well-known environmental issue in the agricultural sector. Proper management of the nitrogen flows, from feed intake to manure is also an important lever for dairy farmers to improve their sustainability record. Highlighted as potentially relevant through normalisation.

Why “communicate” ?

- ➔ Change impact of products (e.g. chain partner)
- ➔ Raise awareness (e.g. NGO, government)
- ➔ Increase visibility and positive image (production chain)
- ➔ Competition (e.g. retailer schemes)
- ➔ Change habits/ direct markets (policy makers)
- ➔ Show positive evolution / improvement (chain partner)
- ➔ Inform and educate consumers (production chain)

Way to communicate depends on what is its aim

connect to the world of dairy

Communication

→ Idea to improve envi footprint

→ Dairy pilot tests:

- Study 1: A specific release in the company monthly newsletter sent to up to the **farmers** working with the company
- Study 2: **B2C label** on PEF performance with information regarding the three impact categories in comparison with some other labels, e.g. different PEF performance labels (lights, scale) and sustainability label with information to environmental information, animal welfare, social aspects
- Study 3: a dedicated **survey**, in **dairy-related circles** and association environment; with very simple communication of performance numbers and overall message on 'acting together'

Greenhouse Gas Emissions

Equivalent to 500 grams of CO2

Land Occupation

Creates a 28 Kg Carbon deficit

The environmental impacts*

of 50 grams of Butter

Water Consumption

0,6 Litres of water

Aquatic Eutrophication

Equivalent to 2 grams of nitrogen

Part of respondents finding the indicator quite easy to understand

Chaque étape du cycle de vie du  :

- contribue au changement climatique (% de kg CO₂)

- agit sur la transformation des sols (% de Carbone soustrait du sol)

- contribue à l'épuisement de la ressource en eau (% de m³ d'eau équivalent)

Légende :

- Matière première (lait)
- Emballages
- Transformation
- Transport et distribution
- Consommation
- Fin de vie

017

Pour aller plus loin

Vous êtes de plus en plus nombreux à vous soucier de l'impact environnemental de votre exploitation. Cette étude illustre tout l'intérêt du travail réalisé sur la limitation des Gaz à Effet de Serre de la filière laitière et encourage la poursuite des pratiques favorisant le stockage de carbone dans les sols. La ressource en eau, nécessaire à la production laitière, apparaît également comme un axe fort sur lequel il nous est impor-

tant d'agir à chaque étape du cycle de vie : aussi bien en fromagerie qu'en exploitation.

Quelle est la performance de votre exploitation sur ces trois indicateurs ? Bel vous accompagne dans l'identification de vos bonnes pratiques environnementales et de vos axes de progrès. À l'issue d'un diagnostic réalisé avec le logiciel Cap'2Er, des pistes d'actions personnalisées vous

sont proposées, adaptées à votre exploitation.

PAR CURIOSITÉ, J'AI RÉALISÉ UN DIAGNOSTIC AVEC V. GALLARD. MÊME SI CELA RESTE LOIN DE MON QUOTIDIEN, CELA M'A PERMIS DE ME SITUER.

Dominique DAMAY
Éleveur en Mayenne

POUR NOUS PRODUCTEURS, LA NOTION DE GAZ À EFFET DE SERRE EST NOUVELLE. LE CAP'2ER NOUS A PERMIS D'APPRÉHENDER L'IMPACT ENVIRONNEMENTAL DE NOS PROJETS (COUVERTURE DE FOSSE).

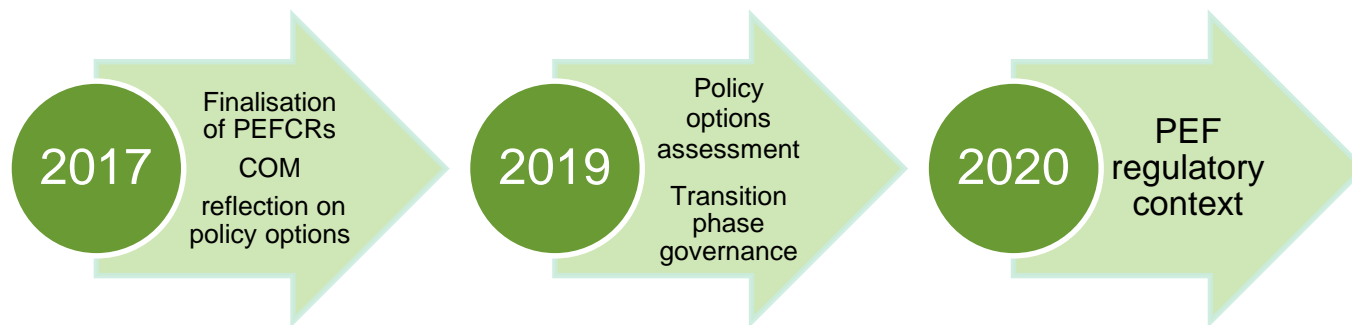

Bertrand GESLIN
Éleveur en Sarthe

*Qu'est-ce qu'une Analyse de cycle de vie (ACV) ?

L'ACV est un outil de mesure des impacts environnementaux d'un produit – dans le cas présent, le Mini Babybel®. Son objectif est de connaître et comparer l'impact d'un produit sur l'environnement tout au long de son cycle de vie : de la production des matières premières (le lait par exemple) jusqu'à son traitement en fin de vie (recyclage, etc) en passant par l'exploitation des ressources naturelles.

- ➔ Pilot phase - What works, what does not?
 - Data requirements – esp. at raw milk production stage
 - Question of benchmarks – meaning and usefulness?
- ➔ Harmonised approach - positive
- ➔ Communication phase - transporting information to improve environmental performance
 - Build on existing experience in chain
 - No interest in on-pack labelling
- ➔ Positive outcome of work together
- ➔ 'Improvement tool'

Upcoming timeline

➔ What is ahead?

- Future EU legislation
- Use in companies – already exists: improvement tool, ecodesign, environmental measurement
- Updating data sets esp. on farm level

Positioning on PEF

➔ What use in companies?

- many still reflect, complex but **helpful tool** to preven misleading claims and show improvement; several indicators positive as not only carbon-related, but **complexity** not easy to communicate
- Use in companies has started: ecodesign, **environmental improvement tool**, supply chain contacts

➔ What idea of legislative frame

- **Voluntary framework**; no distortion across EU (and beyond) if harmonised approach

➔ Communication/ information tools

- **Business information** (CSR; Annual reports); no on-pack labelling; possibly website communication, thinking about alternative approaches (e.g. QR-codes)

Working for an always more healthy and sustainable dairy sector
