## 1. Lime application in Swiss Agriculture

Major Provider of lime for Swiss agriculture are the sugar beet refining industry, transhipment companies (imports), gravel plants and atomic power plants with cooling towers (Grünig 2009). Estimates for total lime application are given in Table 1. Estimates for RICOTER, FENACO-LANDOR and the atomic plants (Leibstadt and Gösgen) are based on information by the respective companies or retailers. At the time being no specific information is available for KIWE-CA (Gravel plants) and Peter Briner AG. Therefore estimates were made based on indications made by third parties. Only lime applied as  $\text{CaCO}_3$  or  $\text{CaMg}(\text{CO}_3)_2$  is considered in this report. While carbonate limes are the dominant liming material used, oxides and hydroxides of lime, which do not contain inorganic carbon, are used to a limited extent for agricultural liming but are not included here.

Due to the only rough estimates mainly based on expert judgement the resulting number of total lime application in agriculture is highly uncertain. A relative uncertainty of  $\pm 40\%$  can be used as an approximation (95% confidence interval).

## 2 Detailed information on lime providers in Switzerland

Producer	Reference
RICOTER	"Ricoter Erdaufbereitungs AG" is commercializing lime that results as a by-product in the sugar beet refining industry (Ricokalk). Yearly quantities are estimated at 50'000t for 1990 and 55'000t for 2008 with fluctuations according to fluctuations in sugar beet harvests. Lime content is in average approximately 55% resulting in total lime application of <b>27'500t and 30'250t for 1990 and 2008</b> respectively.
FENACO-LANDOR	FENACO-LANDOR is a fertilizer transhipment company. The amount of lime imported and commercialized via FENACO-LANDOR is estimated to be in the order of <b>24'000t for 2008 and 8'000 for 1990</b> .
KKW (Leibstadt, Gösgen)	Atomic plants with cooling towers are a major producer of lime. Before the water enters into the cooling system it has to be decalcified. The amount of lime (CaCO <sub>3</sub> ) produced by a plant with a thermal capacity of 3 GW is approximately 10t per day. There are two atomic plants with the respective cooling towers in Switzerland: Leibstadt with a capacity of 9.3 GW (2008) and Gösgen with 7.6 GW (mean 1990-1999). The according amount of lime is 20'440t, lying close to the 20'000t estimated by Würsch (2009). Due to the lack of precise data 10'000t are assumed for the Gösgen plant. For Leibstadt more detailed information is available from Leureko AG (Leuenberger 2009). 7'200t are exported to Germany and 1'800t are sold in Switzerland. Accordingly the total amount of lime originating from atomic power plants is <b>11'800t</b> . The same number is applied for the whole time series.
KIWE-CA Kieswerke	KIWE-CA is a provider of lime from gravel plants. The KIWE-CA cooperative was founded in July 2004 and is probably of minor importance compared to other providers. Meanwhile an amount of 5'000t per year from 2004 onward is estimated.
Peter Briner AG	Peter Briner AG is a provider of lime east of Winterthur. Detailed data is not available but total amounts are probably of minor importance. A total amount of 3'000t per year is estimated.

---

Thomasmehl

"Thomasmehl" is a by-product of the steel industry. Its composition is on average: 14–16 % P<sub>2</sub>O<sub>5</sub>, 45–55 % CaO, 2–4 % MgO, 6–8 % SiO<sub>2</sub>, 12–16 % Ironoxides, 1–2 % Al<sub>2</sub>O<sub>3</sub> and 5–10 % Manganoxides. CaO is not causing any CO<sub>2</sub> emissions and "Thomasmehl" used as fertilizer is therefore not reported here. Thomasmehl has been commercialized in Switzerland until 1997. Therefore a subsequent increase of lime application in the form of CaCO<sub>3</sub> is plausible.
